Professor Yamir Moreno
Editor-in-Chief
Journal of Complex Networks

Dear Professor Moreno,

Please consider the manuscript “Residual spectral graph learning for connectivity-loss estimation under multi-edge disruptions” as an original research article in the *Journal of Complex Networks*.

The paper studies a structural problem at the intersection of network spectra, spatial infrastructure networks, and graph machine learning. Its central contribution is a hybrid estimator that learns only the finite-perturbation residual of an interpretable Fiedler edge-sensitivity approximation. The design is evaluated under independent and spatially correlated edge failures, with graph-disjoint synthetic tests, five OpenStreetMap networks, geographically blocked leave-one-area-out transfer, feature and architecture ablations, seed-level paired bootstrap intervals, error-stratified analysis, and controlled computational scaling. A reliability-context extension that failed to transfer is reported transparently as a negative ablation.

The manuscript fits the journal’s interests in mathematical and numerical analysis of networks, network spectra, structural analysis, spatial networks, infrastructural networks, and AI for network complexity. The code, cached graph instances and compact result tables are available at github.com/lee-vtruong/ResiliRoad.

This manuscript is not being submitted elsewhere. Any related VMS60 poster or abstract will be disclosed in the submission record; the journal manuscript is substantially extended by multi-area transfer, controlled scaling, calibration, negative-result analysis and journal-specific discussion. Generative AI tools were used for language editing and software-development assistance. The author designed the study, checked the implementation and results, and accepts full responsibility for the submitted work.

Thank you for your consideration.

Sincerely,

Van-Truong Le
